L2: THE AGENTIC AI COURSE

Build Autonomous AI Systems That Actually Work

DEVOPS INSIDERS

L2: Agentic AI Course

Networking Opportunities

Join a thriving community of AI developers and engineers. Collaborate on real-world projects, share insights on autonomous agents, and expand your professional network.

About Us

Master in-depth Python to build production-grade AI systems. We provide hands-on training in Langchain, Langgraph, MCP, RAG, LiteLLM Gateways, and AI observability.

BECOME FDE ENGINEER

Discover the Future

NEW BATCH

Commencing on

11th October 2026

We are excited to have you

Meet the aluminis

Core Team

Ashish Kumar

Project Manager
Ensuring Quality of Delivery and Public Relations.

Aman Gupta

Senior DevOps Engineer
Driving technical excellence and fostering positive public relations.

Atul Singh

Technical Architect
Overseeing the implementation of complex technical solutions

Ravi Ranjan

Accountant
Ensuring financial accuracy and fostering positive client relationships.

Rishav Raj

Head of Finance
Finance leader enhancing growth with strategic insights.

Abhishek Singh

Corporate Legal Advisor
Legal Strategy, Corporate Governance & Compliance

Anubhav Mehra

Operations Lead
Driving efficiency and excellence through streamlined processes and execution.

We are not trainers, पढ़ाना हमारा शौक है।

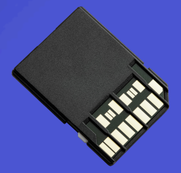
AGENTIC AI ROADMAP

Start



Finish!

Step One

Foundations & Models

- Python
- APIs (OpenAI, Claude, Bedrock)
- Local LLMs (Ollama)

Step Two

Context & Memory

- RAG Architecture
- Embeddings
- Vector DBs (Pinecone, Qdrant, Chroma)

Step Three

Frameworks & Agents

- LangChain & LangGraph
- CrewAI (Multi-Agent)
- Tool Calling & MCP

Step Four

Prod AI & Voice Agents

- AI Gateways (LiteLLM)
- Observability (Langfuse)
- Voice Agents (ElevenLabs, Sarvam)

SYSTEM DESIGN ROADMAP

Start

Step One

System Design Fundamentals

- Client–Server Architecture
- HTTP, DNS & Networking
- APIs & REST
- Latency, Throughput & Availability

Step Two

Databases & Caching

- SQL vs NoSQL
- Indexing & Replication
- Sharding & Partitioning
- Redis, Caching & CDNs

Step Three

Scalability & Distributed Systems

- Load Balancers
- Monoliths vs Microservices
- Message Queues & Events
- CAP Theorem & Consistency

Step Four

Reliability & Production

- Fault Tolerance & Retries
- Rate Limiting & Security

Design at Scale!

Real-World Capstones: What We Will Build

Bridging the gap between Product Vision and System Architecture.

DEVOPS INSIDERS

Build Enterprise-Grade AI Products from Scratch

Stop building toy apps. Learn how to architect, develop, and deploy production-ready systems using Agentic AI.

End-to-End Development: From edge sensors and streaming data to interactive React frontends and FastAPI microservices.

Agentic AI Integration: Wire up LLMs, LangGraph, and MCP to create intelligent Copilots and DevOps agents that actually perform tasks.

Modern Enterprise Stack: Master Kubernetes, Kafka, GitOps, and vector databases in a real-world architecture.

AI as your Co-Founder: Learn how to use Agentic AI not just as a feature in the product, but as your primary tool to write the code and build the platform.

DEVOPS INSIDERS x NextOps INDUSTRIAL

AI-Powered Self-Healing Kubernetes Infrastructure

Build a conversational, self-healing infrastructure assistant that integrates securely with kubernetes.

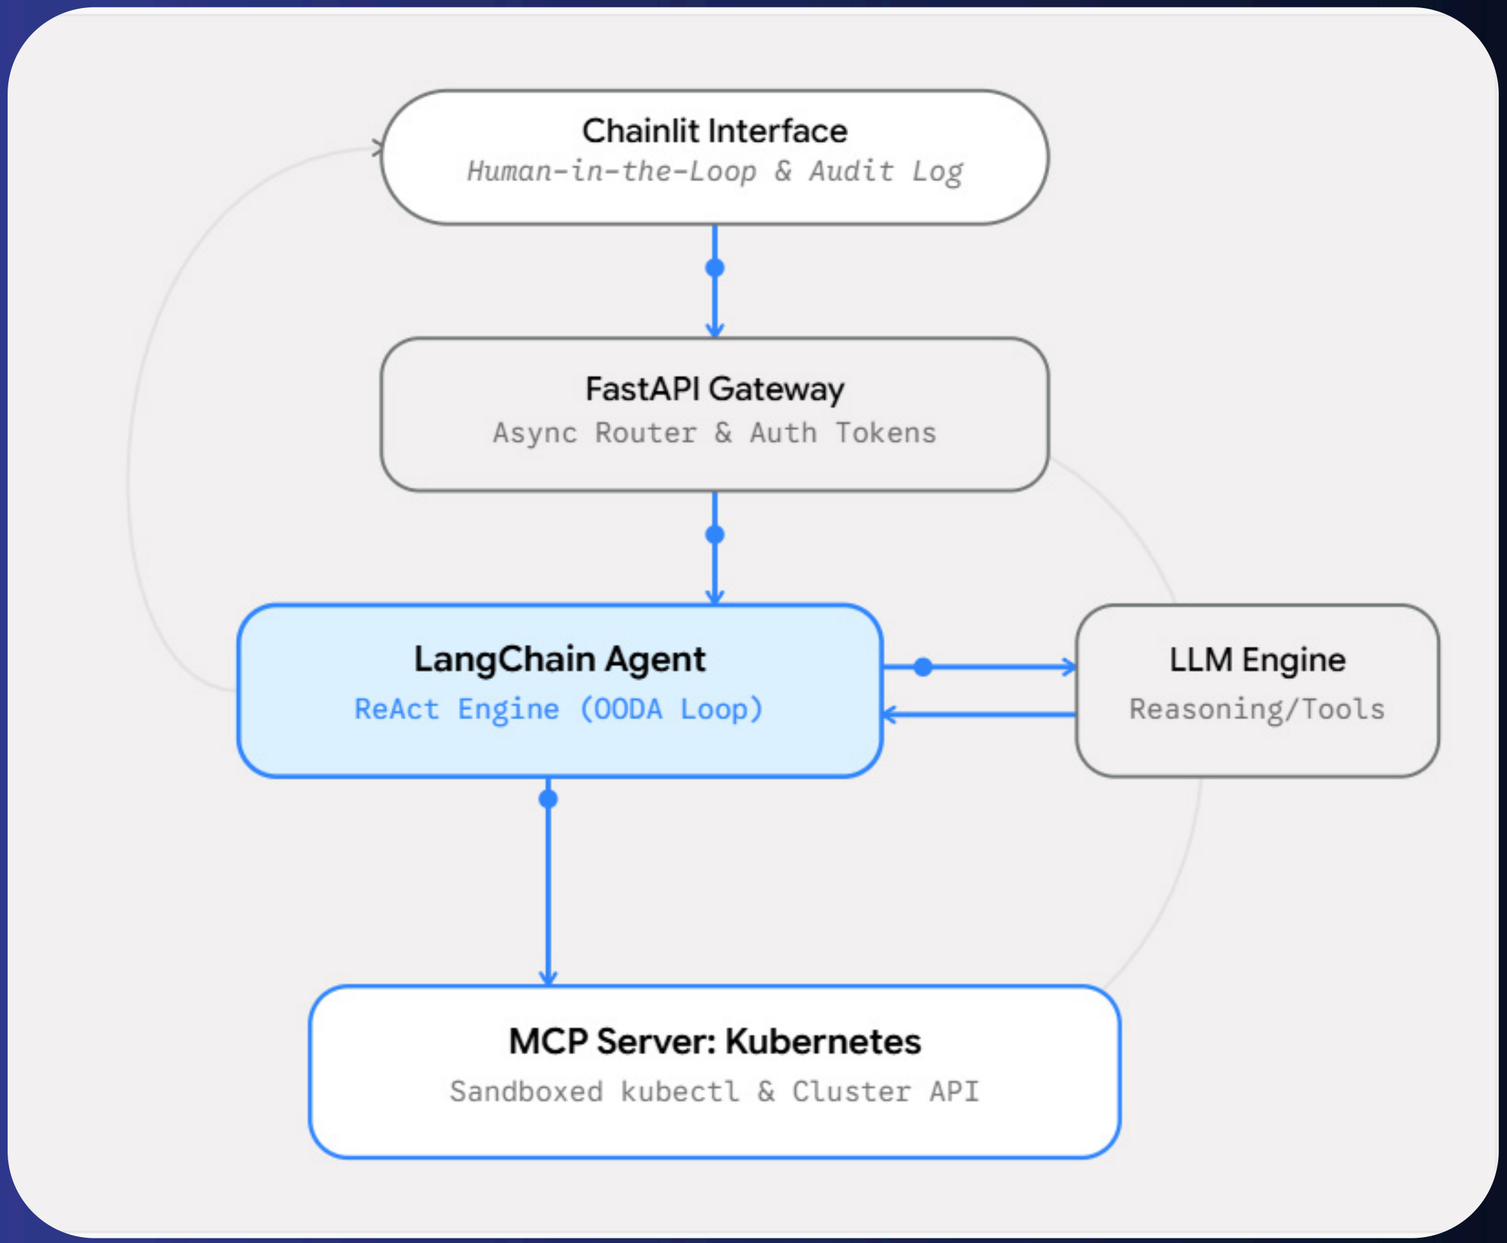
Autonomous Remediation: Construct an OODA loop (Observe, Orient, Decide, Act) using LangChain ReAct agents.

Sandboxed Execution: Securely isolate kubectl commands and cluster API calls using a dedicated Model Context Protocol (MCP) server.

Human-in-the-loop (HITL): Design interactive Chainlit UI workflows requiring explicit approval before executing destructive cluster actions.

Asynchronous Orchestration: Route authenticated tokens and handle concurrent tasks effortlessly with FastAPI.

DEVOPS INSIDERS x AXION SYSTEMS



Master Production-Ready RAG Architecture

Building a Scalable, Secure AI Chat Platform with FastAPI, Celery, Qdrant, PostgreSQL, and OpenAI

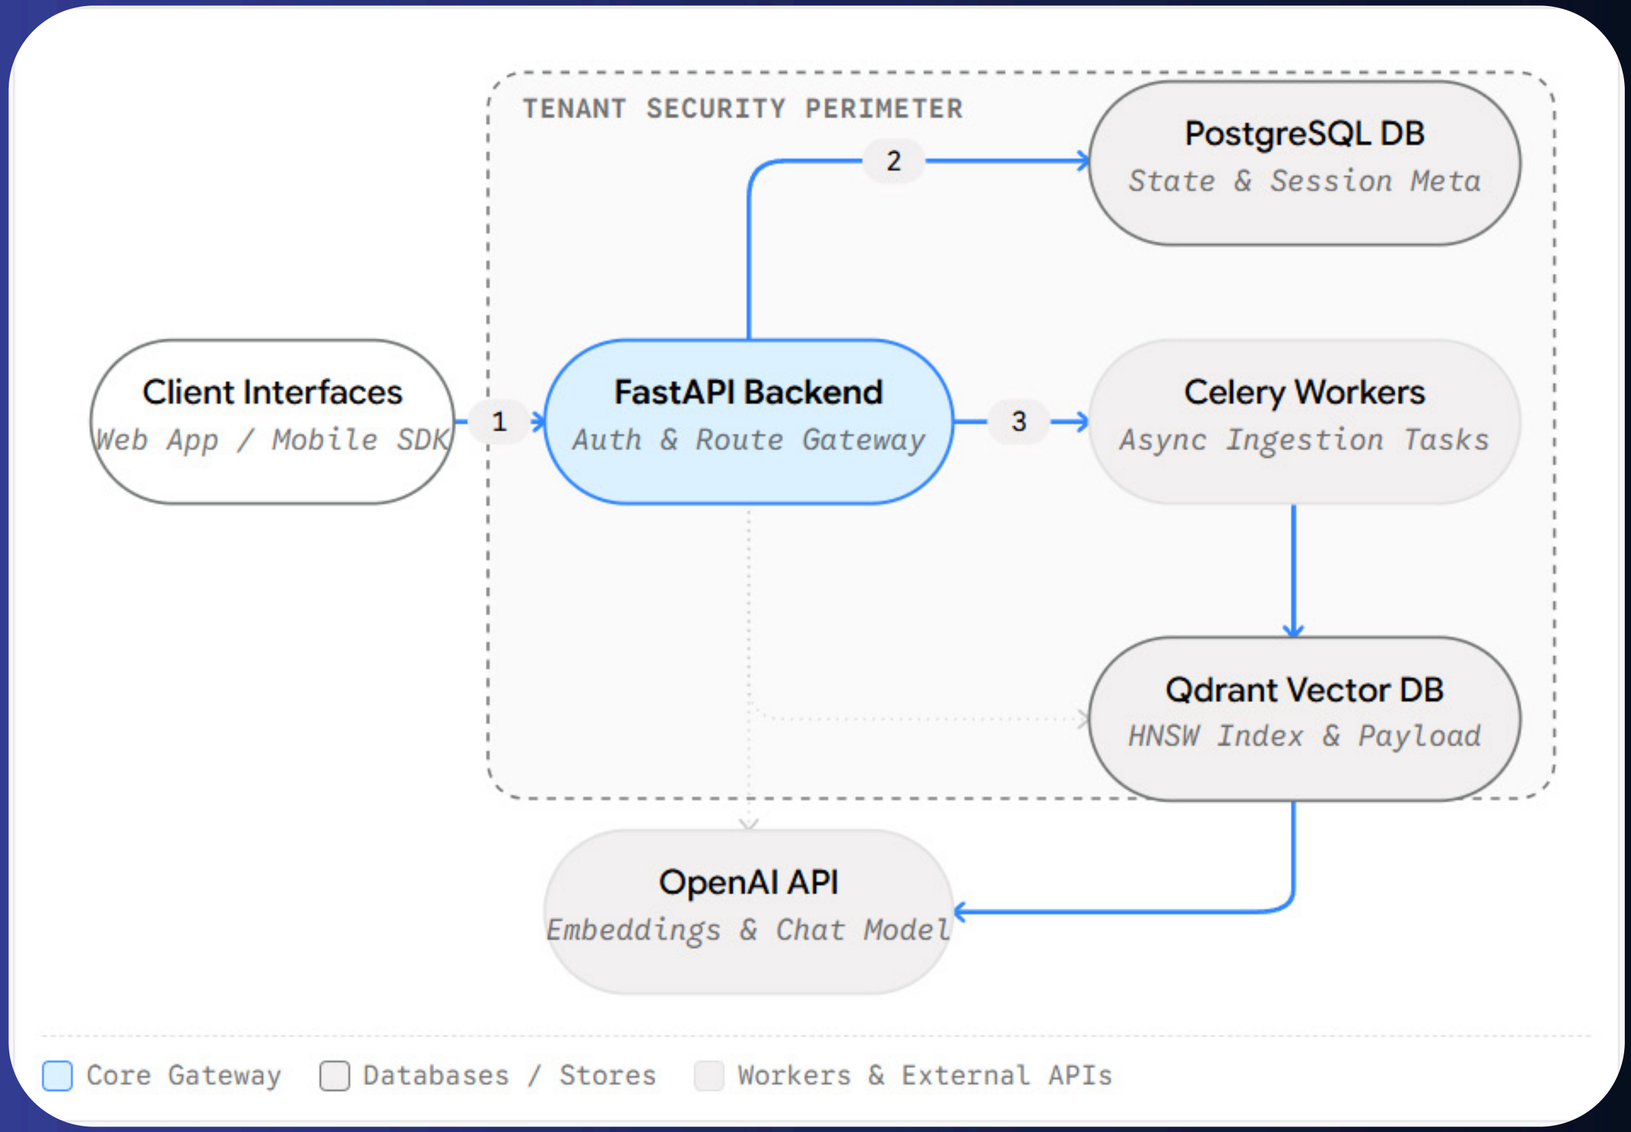
Design Scalable Gateways: Build a secure FastAPI backend to route client requests and manage authentication.

Implement Async Ingestion: Use Celery workers to decouple heavy web scraping and embedding tasks from the live chat API.

Enforce Tenant Isolation: Learn to securely partition multiple users' data within a single Qdrant vector database.

Orchestrate LLMs: Connect your isolated data stores to OpenAI's API to build a fully functional, grounded chat agent.

DEVOPS INSIDERS x embedyour.chat



AI Enabled Airport Lost-and-Found Triage System

Automating Baggage Recovery with Kafka, FastAPI, and LLM-Based Item Matching

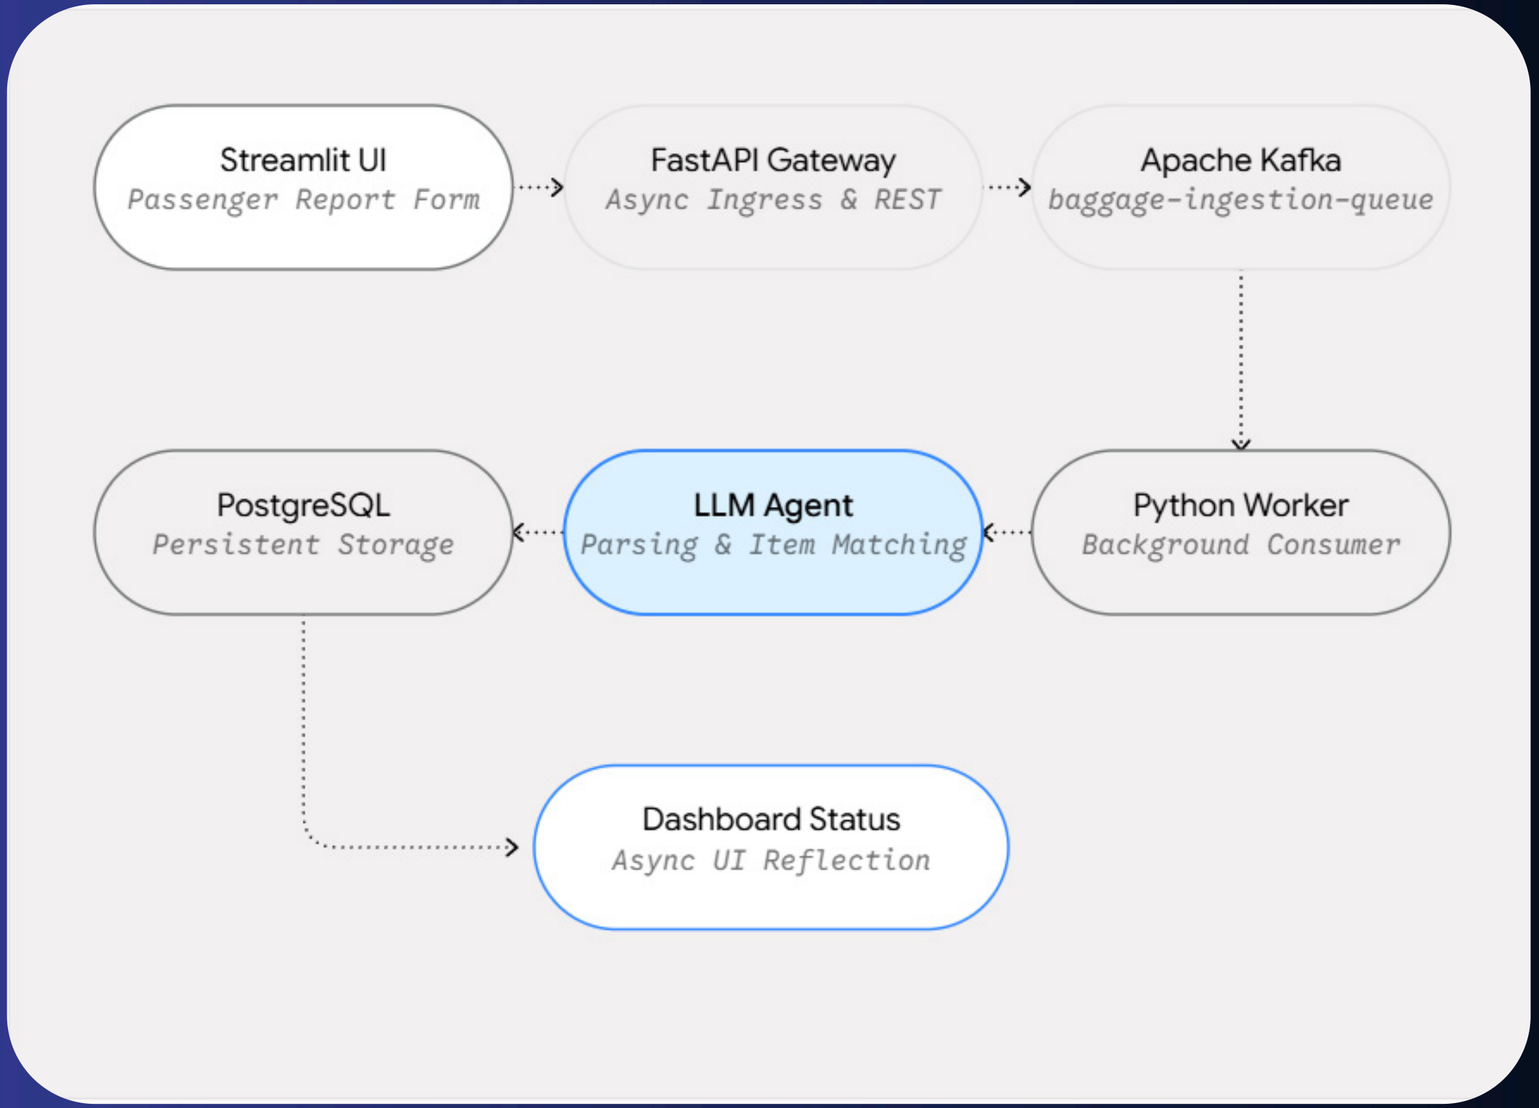
Ingestion: Passenger submits lost baggage details on the Streamlit web form; FastAPI captures the request and returns an instant 202 Accepted response.

Event Queuing: The event payload is published to Apache Kafka, decoupling the frontend from heavy compute tasks.

Background Processing: A Python worker consumes the message from the queue and passes it to the LLM agent for attribute parsing.

State Persistence & Reflection: The matched result is saved into PostgreSQL, and the Streamlit UI updates asynchronously to display the final resolution status.

DEVOPS INSIDERS x AeroBag.ai



Only Genuine, Interested , Hardworking, कर्मयोगी, और प्रयासर्थी छात्र Allowed.
